Project Name: Star Wars Database search engine

Team 8: Maud Werkman, Ricardo Baca, Alexander Redman

CST 205, May 14 2018

How to run our code:
FIrst one want to be in the "Team-8-Master-Repo" directory then you want to type "FLASK_APP=hello.py flask run" to run on your local host and then you copy and paste this link "http://127.0.0.1:5000/" into your browser. Once you open the Star Wars Database search engine you can type in Star Wars characters, planets, ships, and more to see specific information about what you searched.

Github Link: https://github.com/aredmancsumb/Team-8-Master-Repo

Future Work: In the future we would like to have pictures for every possible search so you can see what you're looking at. Also we would like to add more API's in future for example a pokemon and marvel API. We were unable to add these API's in because the star wars API was so hard to format and took so much time.
